

Protect Your Business from Web-based Threats

No matter what your business is today, most businesses provide internet access to employees in order to keep their business competitive and productive, with the result that protecting data and monitoring internet use are key priorities, even for the smallest IT team. It seems that every day a new threat emerges to threaten data security, including spyware, keylogging, phishing, pharming and worms. How can you protect your critical data assets when firewalls and antivirus software alone are just not enough protection? With Resilience CWR real availability security solutions and Websense's web filtering and security applications.

Benefits

- Resilience integrated High Availability provides the ability to configure Websense Filtering Service and Policy Server in failover, meaning your protection is 24/7
- Fast, easy installation and preinstalled software with intuitive interface
- Two levels of Real Availability: iHA Hot-Standby and iHA Ready scale availability to meet your needs
- Self-configuring modules that lower staff burden for deployment, administration and recovery
- No hardware End Of Life with Continuous Secured Ownership warranty

Deep Automation, Real Availability, Global Control.

About Resilience

Resilience delivers data security solutions with the deep automation and real availability demanded by busy IT departments for critical applications. Backed by the Resilience Continuous Secured Ownership warranty and industry-leading support, Resilience's high performance appliances deliver zero downtime, enable 15 minute provisioning and automation of key tasks like Monitoring and Recovery, and lower operating costs. Established in 1995, Resilience is based in Mountain View, CA. With 3 patents in high availability technology, Resilience solutions are installed in leading financial, aerospace, military and other organizations around the world.

Why You Need Websense

Websense offers the industry's leading web security solution that protects your business against the potential dangers exposed by users browsing the web. Websense web security adds an additional layer of web security against endpoint risks in an overall security strategy, enabling IT teams to identify threats and block access at internet gateways.

Why You Need Resilience CWR

Resilience believes that without deep automation and real availability, networks don't have security. Our integrated high availability, self-configuring modules, and RESlink connectivity permit fast setup, hot-swap recovery and upgrades in the field in minutes, delivering the true data security that our customers need. Resilience CWR web security appliance platforms also allow for multiple deployment options to deliver flexibility, performance, and the deep automation and ease of use required by any sized business.

Single Appliance Configurations

You can choose to configure your system as a single appliance solution in the following ways:

- The Web Security Solution (Websense Web filtering service, which includes the Network Agent and Policy Server) alone
- The Web Security Solution with Proxy
- The Web Security Solution and Reporting (Explorer for UNIX)

- The Web Security Solution, with Proxy, and Reporting all on a single appliance

Distributed Appliance Configurations

- For higher performance needs, you can run Web Security Solution (with or without optional Proxy) on one appliance, and Reporting on another

Continuous Secured Ownership

Resilience adds one more critical component to your solution: Continuous Secured Ownership warranty (CSO). This warranty effectively removes hardware End of Life from your web security solution. Any appliance purchased with CSO is guaranteed:

- If any component breaks, Resilience will replace the entire system
- The entire value of the appliance can be applied to future models
- Resilience will continue to support the appliance, long after other vendors

Resilience web security solutions are available in a range of performance standards and configurations to meet any business need. Resilience also offers a full suite of firewall and security appliances that deliver complete network security with one convenient point of support.
