

What's New in Hosted Email Security v5.1?

Websense Hosted Email Security v. 5.1 now offers **extended data loss prevention (DLP)** capabilities. Organizations from small to large are requiring the ability to protect essential information from being accidentally or maliciously sent out via email. For businesses that want content filtering and DLP functionality to prevent sensitive data from getting into the wrong hands via email – Websense Hosted Email Security offers the ability to easily set up pre-defined policies, use out-of-the-box templates for some of the most pressing data security standards, and ensure data is encrypted when necessary—all available in a cost-effective hosted deployment.

Using intelligence from Websense Data Security Suite, the company's industry-leading data loss prevention solution – Websense Hosted Email Security now has the following new capabilities:

- **Pre-defined content dictionaries** covering 20 topics in 12 languages to easily enforce acceptable use policies, safeguard private and confidential data, and meet regulatory requirements
- **Built-in compliance templates** to help ensure compliance with the Payment Card Industry Data Security Standard (PCI-DSS) and US state data privacy laws
- **True file-type identification** to recognize and control content in over 400 different attachment types without relying on filename extensions
- **Flexible content rules** with advanced regular expressions to customize content inspection to meet unique requirements
- **Policy-based encryption** that combines content inspection and encryption to securely transmit documents containing sensitive information
